

# MCS

*MCS focuses on the development of the MCS Enterprise Facility Management Software (MCS eFMS). This is an Oracle-based modular software suite, including applications for space management, helpdesk, room reservations, cabling, financial management, maintenance, reporting, etc. Thanks to its innovative technology, our FMIS is used in many countries around the world.*

MCS was established in 1989 and can be considered as a pioneering software company in the field of facility management. Based in Antwerp, we focus on consultancy and the development of a comprehensive, modular software suite, called the MCS Enterprise Facility Management Software (MCS eFMS).

MCS eFMS consists of several software modules which can be implemented in their own right. Each module corresponds to a distinct facility management discipline, but together they form a powerful combination, fulfilling the needs of any facilities department. Applications include space and asset management, helpdesk, meeting room reservations, cabling, quality, financial management, operational and strategic reporting and many more.

All our solutions are brought to you through a project oriented approach. We discuss the current situation together and we'll make a wish list of improvements. Looking for the appropriate products to be used, the solution can then be presented all at once, or in phases where we'll look at available budgets and cost/benefit aspects.

Our goal is to develop and implement organization-wide, Oracle-based facility management information systems supporting and streamlining the daily work of modern facility management departments. We offer substantial and measurable cost savings within 6 months till 1 year. Our clients are typically large organizations, but we see that smaller companies also find their way to MCS.

Because of its vast range of features MCS eFMS has earned international recognition. Siemens decided to use our software for managing worldwide 11,4 million m<sup>2</sup>, e.g. in France, the United Kingdom, Brazil, Russia and China. The same is true for ISS: MSC eFMS was implemented in various European sites, including Denmark, Norway, Finland, Sweden, the Netherlands, Italy, Switzerland, Ireland, Austria and Spain. Just like with Siemens, MCS eFMS is also used by their most important customers, e.g. Nordea Bank. The whole story can be consulted on [www.mcs.be](http://www.mcs.be).

Our growth has been made possible by developing innovative products. One example is MCS Drawing Interface, an add-on module that doesn't use a link between CAD and the FMIS database. On the contrary, both environments form one, single entity. If you make a modification on a drawing (e.g. moving an asset to another room), the database is immediately updated, and vice versa. Consequently drawings are always up-to-date, eliminating any inconsistencies.

Many contemporary national and international organizations are choosing for MCS. Take a visit to [www.mcs.be](http://www.mcs.be) and find out why.
